(54) Title: METHODS FOR LABELING β–AMYLOID PLAQUES AND NEUROFIBRILLARY TANGLES
(57) Abstract

A method for labeling β–amyloid plaques and neurofibrillary tangles *in vivo* and *in vitro*, comprises contacting a compound of formula (I) with mammalian tissue. In formula (I), R_1 is selected from the group consisting of –C(O)–alkyl, –C(O)–alkylenyl–R_4, –C(O)O–alkyl, –C(O)O–alkylenyl–R_4, –C=C(CN)$_2$–alkyl, –C=C(CN)$_2$–alkylenyl–R_4, (a), (b) and (c); R_4 is a radical selected from the group consisting of alkyl, substituted alkyl, aryl and substituted aryl; R_5 is a radical selected from the group consisting of –NH$_2$, –OH, –SH, –NH–alkyl, –NHR$_4$, –NH–alkylenyl–R_4, –O–alkyl, –O–alkylenyl–R_4, –S–alkyl, and S–alkylenyl–R_4; R_6 is a radical selected from the group consisting of –CN, –COOH, –C(O)O–alkyl, –C(O)O–alkylenyl–R_4, –C(O)alkyl, –C(O)–alkylenyl–R_4, –C(O)–halogen, –C(O)NH$_2$ –C(O)NH–alkyl, –C(O)NH–alkylenyl–R_4; R_7 is a radical selected from the group consisting of O, NH, and S; and R_8 is N, O or S. R_2 and R_3 are each independently selected from the group consisting of alkyl and alkylenyl–R_{10}, wherein R_{10} is selected from the group consisting of –OH, –OTs, halogen, spiperone, spiperone ketal and spiperone–3–yl. Alternatively, R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs, halogen, alkylenyl–R_{10}, carbonyl, spiperone, spiperone ketal and spiperone–3–yl. In the compounds of formula (I), one or more of the hydrogen, halogen or carbon atoms can, optionally, be replaced with a radiolabel.

METHODS FOR LABELING β-AMYLOID PLAQUES
AND NEUROFIBRILLARY TANGLES

Background of the Invention

Alzheimer's disease affects approximately 20 to 40% of the population over 80 years of age, the fastest growing age group in the United States and other post-industrial countries. Common features in the brain of patients with Alzheimer's disease include the presence of abundant intraneuronal neurofibrillary tangles (NFTs) and extracellular amyloid rich β-amyloid plaques. NFTs are cytoskeletal pathologies largely composed of aggregates of hyperphosphorylated tau proteins assembled into periodically restricted amyloid fibers called paired helical filaments. The major component of amyloid plaques is a peptide, a small 39-43 aminoacid long β-amyloid peptide that is generated from the cleavage of a larger amyloid precursor protein. However, except for diffuse plaques formed almost exclusively of B-amyloid peptides, amyloid plaques are complex lesions containing numerous associated cellular products. Mutations causing increased production of the 42 amino acid form of this peptide have been genetically linked to autosomal dominant familial forms of Alzheimer's diseases. Deposits of β-amyloid occur very early in the disease process, long before clinical symptoms develop. Because these mutations appear to be pathogenic and cause Alzheimer's diseases in transgenic mice, β-amyloids are widely believed to play a causal role in the disease. Whether or not amyloid deposits are causal, they are certainly a key part of the diagnosis. Further, because amyloid plaques occur early in the disease, the ability to image deposits would provide a convenient marker for early diagnosis and prevention of the disease as well as a method for monitoring the effectiveness of therapeutic regimens.

Alzheimer's disease is currently definitively diagnosed by taking sections from postmortem brain and quantifying the density of neocortical amyloid deposits. Unfortunately, current techniques for detecting amyloid deposits and/or NFTs require postmortem or biopsy analysis. For example, thioflavin fluorescent-labeling of amyloid in brain sections *in vitro* is currently a widely-used method for evaluation of the brain. Another potential amyloid probe, Chrysamine-G, a congo red derivative, has also been developed. Congo red is a charged molecule and thus lacks sufficient hydrophobicity for diffusion through the blood brain barrier and is therefore not useful as an *in vivo* label. See Klunk et al, Neurobiology of Aging, 16:541-548 (1995), and PCT Publication No. WO 96/34853. Chrysamine G enters the blood brain barrier better than Congo red, but its ability to label amyloid plaques in Alzheimer's brain appears weak. See for example, H. Han, C-G Cho

1   and P. T. Lansbury, Jr *J. Am. Chem. Soc.* **118**, 4506 (1996); N. A. Dezutter et al, *J. Label. Compd. Radiopharm.* **42**, 309 (1999). Similarly, earlier attempts to use monoclonal antibodies as probes for in-vivo imaging of β-amyloid were hampered by their limited ability to cross the blood brain barrier. See R. E. Majocha et al, *J. Nucl. Med.* **33**, 2184 (1992). More recently, the

5   use of monobiotinylated conjugates of 1251-Aβ 1-40 with permeability through the blood brain barrier has also been proposed (See Y. Saito et al., *Proc. Natl. Acad. Sci. USA* **22**, 2288 (1991)), but its ability to label β-amyloid plaques and/or NFTs *in vivo* has not yet been demonstrated. Quantitation of the deposits *in vivo* is not yet possible with the currently available probes. Accordingly, a need exists for a convenient marker for early diagnosis of Alzheimer's disease.

10   *In vivo*, non invasive determination of regional cerebral glucose metabolic rates (rCMRGl) with positron emission tomography (PET) has been an important tool in the assessment of brain function in Alzheimer's disease patients. Numerous studies using 2-[F-18]fluoro-2-deoxy-D-glucose (FDG) have demonstrated a characteristic metabolic pattern of hypometabolism in temporoparietal and frontal association areas. A few of these studies have compared rCMRGl with postmortem

15   regional neuronal pathology. These results and the uncertainties of the Alzheimer's disease pathogenic cascade highlight the importance of assessing amyloid and neurofibril deposition *in vivo*, non-invasively in these patients.

Summary of the Invention

20   The present invention provides methods for labeling structures, including β-amyloid plaques and neurofibrillary tangles, *in vivo* and *in vitro*, and comprises contacting a compound of formula (I):
25

(I)

                                                    with mammalian tissue. In formula (I), R_1 is selected from the group consisting of -C(O)-alkyl, -C(O)-alkylenyl-R_4,

30   -C(O)O-alkyl, -C(O)O-alkylenyl-R_4, -C=C(CN)$_2$-alkyl, -C=C(CN)$_2$-alkylenyl-R_4,
35   R_4 is a radical selected from the group consisting of alkyl, substituted alkyl, aryl and substituted aryl; R_5 is a radical selected from the group consisting of -NH$_2$, -OH, -SH, -NH-alkyl, -NHR$_4$, -NH-alkylenyl-R_4, -O-alkyl, -O-alkylenyl-R_4, -S-alkyl, and -S-alkylenyl-R_4; R_6 is a radical selected from the group consisting of -CN, -COOH, -C(O)O-alkyl, -C(O)O-alkylenyl-R_4,

1   -C(O)-alkyl,   -C(O)-alkylenyl-R_4,   -C(O)-halogen,   -C(O)NH_2,   -C(O)NH-alkyl,
-C(O)NH-alkylenyl-R_4; R_7 is a radical selected from the group consisting of O, NH, and S; and
R_8 is N, O or S.

In formula (I), R_2 and R_3 are each independently selected from the group consisting of
5   alkyl and alkylenyl-R_{10}, wherein R_{10} is selected from the group consisting of -OH, -OTs,
halogen, spiperone, spiperone ketal and spiperone-3-yl. Alternatively, R_2 and R_3 together form
a heterocyclic ring, optionally substituted with at least one radical selected from the group
consisting of alkyl, alkoxy, OH, OTs, halogen, alkylenyl-R_{10}, carbonyl, spiperone, spiperone ketal
and spiperone-3-yl. In the compounds of formula (I), one or more of the hydrogen, halogen or
10   carbon atoms can, optionally, be replaced with a radiolabel.

For *in vitro* detection of β-amyloid plaques and neurofibrillary tangles in brain tissue, the
plaques are labeled, and the brain tissue is then observed with a fluorescence microscope. For *in* .
vivo detection, the β-amyloid plaques and neurofibrillary tangles in brain tissue are labeled,
preferably by injection of a solution containing a radiolabeled compound of formula (I). The
15   locations of the labeled β-amyloid plaques and neurofibrillary tangles are then observed by any
method capable of detecting and depicting the distribution of the radiolabeled compound within
the body.

According to the methods of the invention, amyloid deposits in cryostat and paraffin
sections of Alzheimer-diseased (AD) brain tissue are labeled with a level of sensitivity similar to
20   thioflavin S. Use of the present invention, however, has several advantages over using thioflavin
S. Namely, no pretreatments are required. Moreover, unlike with thioflavin S, the methods work
with minimal washing and without formalin or paraformaldehyde fixation or differentiation of
tissue. Additionally, stock solution can be kept in the freezer for six months and still produce
acceptable results at 1/100 to 1/1,000 dilutions, eliminating the need to make the stock up fresh,
25   as is required for thioflavin S labeling.

Systemically injected compositions according to the invention readily penetrate the blood-
brain barrier and label amyloid deposits and neurofibrillary tangles demonstrating the ability of
the present compositions to act as an *in vivo* imaging probe. The methods of the invention
achieve *in vivo* labeling and detection of β-amyloid plaques and neurofibrillary tangles in the brain
30   of a living patient. The methods of the invention not only permit detection of Alzheimer's disease,
but also provide a way for physicians to monitor the progress of patients undergoing treatment
for the disease. Thus, physicians can better determine whether a particular treatment method is
successful and worthwhile.

35

1   In still another embodiment, the invention is directed to a composition comprising a
        compound of formula (I):

5

(I)

               R_1 is selected from the group
        consisting of -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)O-alkyl, -C(O)O-alkylenyl-R_4,
10   -C=C(CN)$_2$-alkyl, -C=C(CN)$_2$-alkylenyl-R_4,

 and ;

        R_4 is   a   r a d i c a l   selected from the group consisting
15   of alkyl, substituted alkyl, aryl and substituted aryl; R_5 is a radical selected from the group
        consisting of -NH$_2$, -OH, -SH, -NH-alkyl, -NHR$_4$, -NH-alkylenyl-R_4, -O-alkyl, -O-alkylenyl-R_4,
        -S-alkyl, and -S-alkylenyl-R_4; R_6 is a radical selected from the group consisting of -CN, -COOH,
        -C(O)O-alkyl, -C(O)O-alkylenyl-R_4, -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)-halogen, -C(O)NH$_2$,
        -C(O)NH-alkyl, -C(O)NH-alkylenyl-R_4; R_7 is a radical selected from the group consisting of O,
20   NH, and S; R_8 is N, O or S; R_2 is selected from the group consisting of alkyl and alkylenyl-R_5
        and R_3 is alkylenyl-R_5, and R_5 is selected from the group consisting of -OH, -OTs, halogen,
        spiperone, spiperone ketal, and spiperone-3-yl, or R_2 and R_3 together form a heterocyclic ring,
        optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy,
        OH, OTs, halogen, alkylenyl-R_5, carbonyl, spiperone, spiperone ketal and spiperone-3-yl. One
25   or more of the hydrogen, halogen or carbon atoms can optionally be replaced with a radiolabel.
               The invention is more preferably related to a composition comprising a compound of
        formula (II):
30

(II)

35 R_2 is selected from the
        group consisting of alkyl and alkylenyl-R_{10} and R_3 is alkylenyl-R_{10}, wherein R_{10} is selected from
        the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal and spiperone-3-yl, or R_2
        and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected

1   from the group consisting of alkyl, alkoxy, OH, OTs, halogen, alkylenyl-R_{10}, carbonyl, spiperone, spiperone ketal and spiperone-3-yl, and R_9 is an alkyl, aryl or substituted aryl group, and to pharmaceutically acceptable salts and solvates thereof. One or more of the hydrogen, halogen or carbon atoms can optionally be replaced with a radiolabel.

5

Description of the Drawings

    These and other features and advantages of the present invention will be better understood by reference to the following detailed description when considered in conjunction with the accompanying drawings wherein:

10   FIG. 1A shows 2-(1,1-dicyanopropen-2-yl)-6-dimethylaminonaphthalene (DDNP) fluorescence (ex 490 nm, em 520-530 nm) of amyloid plaques labeled in the cortex of the brain of an Alzheimer's disease patient (X400).

    FIG. 1B shows strong DDNP labeling of plaques and weak DDNP labeling of tangles in the cortex of the brain of an Alzheimer's disease patient (X640).

15   FIG. 1C shows DDNP labeling of a single, large plaque with an amyloid core in human brain (X640).

    FIG. 1D shows DDNP labeling of a plaque in agent Tg2576 HuAPPsw transgenic mouse brain (X500).

    FIG. 1E shows Thioflavin S labeling of a cored plaque in Alzheimer's disease human brain

20 (X640).

    FIG. 1F shows 4G8 antibody labeling amyloid β-protein of a slice of the same human brain shown in FIG. 1E (X640).

    FIG. 2A shows labeling of amyloid injected into rat brain, where an aliquot of β-amyloid 1-40 was allowed to aggregate for 8 days at 37°C, dried onto a gelatin coated slide, and labeled

25 with DDNP, demonstrating fibrillar fluorescence consistent with amyloid.

    FIG. 2B shows labeling of amyloid injected into rat brain, where 8 days after unilateral stereotaxic injection of 3μg of aggregated β-amyloid 1-40 into rat cortex, the rats were injected with 100 μL of 640 μM DDNP into the carotid artery, anesthetized, and sacrificed by perfusion after 20 minutes and the brains were cryosectioned and examined for fluoroescence; FIG. 2B

30 demonstrates *in vivo* DDNP fluorescently labeled amyloid at the tip of the need track (X100).

    FIG. 2C shows a high power view of the *in vivo* DDNP labeled material of FIG. 2B (X200).

    FIG. 2D depicts how formic acid treatment of a section through the injection site removes fluorescent labeling (X100).

35   FIG. 2E demonstrates that DDNP labeling is weak contralateral to the amyloid injection site, where no amyloid is present (X200).

1   FIG. 3A is a PET-[F-18]FDDNP (2-(1.1-dicyanopropen-2-yl)-6-(2-[^{18}F]-fluoroethyl)-methylamino)-naphthalene) image of a brain cross-section through the hippocampus-amygdala-entorhinal/temporal cortex region of an Alzheimer's disease patient.

          FIG. 3B is a PET-FDG (FDG is 2-[F-18]fluoro-2-deoxy-D-glucose) image of the brain

5   cross-section of FIG. 3A.

          FIG. 3C is an MRI image (proton relaxation times) of the brain cross-section of FIG. 3A.

          FIG. 4 is a graph showing the estimated residence times of [F-18]FDDNP in pateints.

          FIG. 5 shows an image (central image) obtained by immunostaining a forty five micrometer cryostate temporal cortex section of an Alzheimer's disease patient incubated with

10   AT8 (anti-phosphotau) and 10G4 (anti-AB1-15) at 1:800. Insets are adjacent sections of the same Alzheimer's disease brain specimen stained with FDDNP showing, beginning in the upper left corner and moving clockwise, (1) neuritic plaques, (2) diffuse plaque, (3) vascular amyloid, (4) dense plaques and tangles, and (5) dense tangles.

15   **Detailed Description of the Invention**

          The present invention is directed to methods for labeling structures such as β-amyloid plaques and neurofibrillary tangles *in vivo* and *in vitro*. The methods all involve contacting a compound of formula (I):

20

$$R_2-N(R_3)-\text{naphthalene}-R_1 \qquad (I)$$

                                    with mammalian tissue. In

25   formula (I), R_1 is selected from the group consisting of -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)O-alkyl, -C(O)O-alkylenyl-R_4, -C=C(CN)$_2$-alkyl, -C=C(CN)$_2$-alkylenyl-R_4,

30

                        and

          R_4 is a radical selected from the group consisting of alkyl, substituted alkyl, aryl and substituted aryl. R_5 is a radical selected from the group consisting of -NH$_2$, -OH, -SH, -NH-alkyl, -NHR$_4$, -NH-alkylenyl-R_4, -O-alkyl, -O-alkylenyl-R_4, -S-alkyl, and -S-alkylenyl-R_4. R_6 is a radical

35   selected from the group consisting of -CN, -COOH, -C(O)O-alkyl, -C(O)O-alkylenyl-R_4, -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)-halogen, -C(O)NH$_2$, -C(O)NH-alkyl, -C(O)NH-alkylenyl-R_4. R_7 is a radical selected from the group consisting of O, NH, and S. R_8 is N, O or S.

1   In formula (I), R_2 and R_3 are each independently selected from the group consisting of alkyl and alkylenyl-R_{10}, wherein R_{10} is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal and spiperone-3-yl. Alternatively, R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group

5   consisting of alkyl, alkoxy, OH, OTs, halogen, alkylenyl-R_{10}, carbonyl, spiperone, spiperone ketal and spiperone-3-yl. In the compounds of formula (I), one or more of the hydrogen, halogen or carbon atoms may optionally be replaced with a radiolabel.

        In a preferred embodiment, the methods of the invention involve contacting a compound of formula (II):

10

                                  (II)

15
                                           with mammalian tissue.
In formula (II), R_2 and R_3 are as defined above, and R_9 is an alkyl, aryl or substituted aryl group.

        As used herein, the term "alkyl" refers to a straight or branched chain monovalent radical of saturated carbon atoms and hydrogen atoms, such as methyl, ethyl, propyl, isopropyl, butyl,

20   isobutyl, t-butyl, pentyl, and hexyl. The term "alkylenyl" refers to a divalent analog of an alkyl group, i.e., methylenyl (-CH_2-), ethylenyl (-CH_2CH_2-), etc. The term "aryl" refers to a mono- or polycyclic substituted or unsubstituted aromatic ring.

        As used herein, the term "lower alkyl" refers to a straight or branched chain monovalent radical having from one to four saturated carbon atoms and hydrogen atoms, such as methyl,

25   ethyl, propyl, isopropyl, butyl, isobutyl, and t-butyl.

        As used herein, the term "heterocyclic ring" refers to a non-aromatic, monocyclic or bicyclic radical containing 3, 4, 5, 6, 7, 8, 9, 10, 11, or 12 ring atoms, each of which is saturated or unsaturated, including 1, 2, 3, 4, or 5 heteroatoms selected from nitrogen, oxygen and sulfur. Nonlimiting examples include aziridine, azetidine, pyrrolidine, piperidine, piperizine and

30   derivatives thereof. Preferably, these heterocyclic rings are substituted with alkyl groups or substituted alkyl groups, for example, alkyl groups having substituents such as those defined for R_4 above.

        For the compounds of formula (I) and formula (II), preferably R_2 and R_3 are each independently alkyl, more preferably lower alkyl. For the compounds of formula (II), preferably

35   R_9 is lower alkyl, more preferably methyl or ethyl, aryl and substituted aryl. Particularly preferred compounds for use in connection with the invention are 2-(1,1-dicyanopropen-2-yl)-6-dimethylaminonaphthalene (DDNP) and 2-(1,1-dicyanopropen-2-yl)-6-(ethyl)(methyl)(amino)-naphthalene, both of which can be optionally radiolabeled. Another preferred compound,

1   particularly for use *in vivo*, is 2-(1.1-dicyanopropen-2-yl)-6-(2- [^{18}F]-fluoroethyl)-methylamino)-
naphthalene ([F-18]FDDNP).

The present invention is also directed to methods for detecting structures, such as β-
amyloid plaques and neurofibrillary tangles *in vitro* and *in vivo*. The term "structures" refers to
5   aggregates of biological materials containing peptides and other cellular materials that may occur
as part of a disease pathology. The term "peptides" includes proteins.

The compounds described above have fluorescent activity in the range of about 470 to
610 nm. In one application, the present invention labels β-amyloid plaques and neurofibrillary
tangles in brain tissue. Accordingly, for *in vitro* detection Alzheimer's disease, the compounds are
10   contacted with brain tissue, and the brain tissue observed with a fluorescence microscope.

For *in vivo* detection, preferably the compounds are radiolabeled. A preferred radiolabel
is ^{18}F, which has a half-life of approximately two hours for position emission tomography (PET).
Another radiolabel is radioiodine, for example, ^{123}I for use with single photon emission computed
tomography (SPECT). Alternatively, other radiolabels are used, such as ^{11}C, ^{13}N and ^{15}O,
15   although these radiolabels are less desirable due to their relatively short half-lives. Any atom in
the compound can be replaced with a suitable radiolabel. Radiolabeling can be achieved by any
method known to those skilled in the art. For example, dry [F-18]fluoride ion [^{18}O(p,n)^{18}F] in
K_2CO_3 (0.75 mg) and Kryptofix 2.2.2™ (19 mg) are added to a solution of the compound of
formula (I) or formula (II) (4 mg in 1 mL CH_3CN). The mixture is heated in an oil bath at 85°C
20   for about 10 to 40 minutes. After cooling and dilution with water, the radiolabeled product can
be purified by preparative HPLC. Kryptofix 2.2.2™ is a crown ether, available from Aldrich
Chemical Co. (Milwaukee, Wisconsin).

A solution containing the radiolabeled compound is then injected into the patient. As used
herein, the term "patient" refers to any mammal, including humans, rats, mice, dogs and cats.
25   Neuroanatomical regions can be determined manually using MRI scans, for example, using a Tela
magnet, and then on amyloid-PET (positron emission tomography) and FDG-PET
(fluorodeoxyglucose-PET) by coregistration of the MRI scans. PET has current resolution of 2
to 3 min, a dynamic determination of radiolabeled compound deposition in the brain, and permits
detection of abnormal areas.

30   By the above-described methods, diseases characterized by the accumulation of β-amyloid
plaques and neurofibrillary tangles such as Alzheimer's disease and other diseases associated with
brain deterioration, can be detected.

EXAMPLES

35   **Example 1**

The following compositions according to the invention were prepared. NMR spectra were
obtained on Bruker AM 360 WB or DPX 300 Spectrometers. ^{1}H chemical shifts are reported in
ppm downfield from TMS as an internal standard. ^{19}F chemical shifts are reported relative to

1   external fluorotrichloromethane. Deuteriochloroform was used as the solvent unless stated otherwise. Melting points were determined on an Electrothermal Melting Point Apparatus and are uncorrected. Elemental analyses were performed by Galbraith Laboratories, Inc., Knoxville, TN or Ms. Metka Kastelic at the Faculty of Chemistry and Chemical Technology, University of

5   Ljubljana. Radial chromatography was performed on Chromatotron (Harrison Research, 840 Moana Court, Palo Alto, CA 94306). The rotors were prepared as recommended by Harrison Research using E. Merck Silica Gel (Cat. No. 7749-3). HPLC was performed on an Alltech Econosil C-18 5 µm, 4.6x250 mm column using a 40:60:2 mix of water : acetonitrile : triethyl amine as the solvent. UV detection at 254 nm was used. Solvents and reagents were from Fisher,

10   Aldrich or Fluka and were used as received unless noted otherwise.

Example 1(a) - Preparation of 2-(1,1-dicyanopropen-2-yl)-6-dimethylaminonaphthalene (DDNP)

15

20
To a solution of 5.26 g (117 mmol) of dimethylamine in 29 mL of freshly distilled hexamethylphosphoric triamide (HMPT) were added 31 mL of dry toluene and 780 mg (112 mmol) of Li in small pieces. The mixture was stirred under argon at room temperature for 1.5

25   hours. 2-Acetyl-6-methoxynaphthalene was prepared as described in Arsenijevic et al., Org. Synth. Coll. 1988, 6:34-36, the disclosure of which is incorporated herein by reference. 2-Acetyl-6-methoxynaphthalene (5.57 g; 27.8 mmol) was added in one portion, and stirring was continued for 20 hours. The mixture was cooled in an ice-water bath and poured into a cold water/ethyl acetate mixture (300 mL each). After thorough mixing, the layers were separated, and the water

30   layer was extracted twice with 225 mL of ethyl acetate. Organic extracts were combined, dried, and evaporated to give a yellow solid. Recrystallization from ethanol afforded 3.67 g (64%) of 2-acetyl-6-(dimethylamino)naphthalene (ADMAN) as a yellow solid, melting at 153.5-155°C: ^{1}H NMR (CDCl$_3$, TMS) δ 2.67 (s, 3H, COCH$_3$), 3.15 (s, 6H, N(CH$_3$)$_2$), 6.87 (d, 1H, H-5), 7.17 (dd, 1H, H-7), 7.63 (d, 1H, H-4), 7.80 (d, 1H, H-8), 7.92 (dd, 1H, H-3), 8.32 (bs, 1H, H-1). $J_{1,3}$ =

35   2.3 Hz, $J_{3,4}$ = 8.7 Hz, $J_{5,7}$ = 2.4 Hz, $J_{7,8}$ = 9.3 Hz. MS (M$^+$) 213: found: 213. Anal. Calcd for C$_{14}$H$_{15}$NO: C, 78.84: H, 7.09; N, 6.57. Found C, 78.96; H, 7.10; N, 6.45.

A mixture of malonitrile (436 mg, 6.6 mmol) and ADMAN (1.278 g, 6.6 mmol) was heated to 110°C in 20 mL of pyridine for 19 hours. After cooling, the remaining red solid was

dissolved in 100 mL of methylene chloride, adsorbed onto 10 g of flash silica get (230-400 mesh) and chromatographed with toluene. Appropriate fractions were combined and evaporated to give 1.12 g (72%) of 2-(1,1-dicyanopropen-2-yl)-6-dimethylaminonaphthalene (DDNP). Recrystallization from benzene-hexane gave red needles melting at 154.5-155°C: ^{1}H NMR (CDCl$_3$, TMS) δ 2.69 (s, 3H, CH$_3$), 3.11 (s, 6H, N(CH$_3$)$_2$), 6.85 (d, 1H, H-5), 7.18 (dd, 1H, H-7), 7.56 (dd, 1H, H-3), 7.66 (d, 1H, H-4), 7.76 (d, 1H, H-8), 8.02 (d, 1H, H-1). $J_{1,3}$ = 2.04 Hz, $J_{3,4}$ = 9.13 Hz, $J_{5,7}$ = 2.5 Hz, $J_{7,8}$ = 9.11 Hz. IR (CHCl$_3$) 2250 cm^{-1} (CN stretching). MS (M$^+$) 261: found: 262. Anal. Calcd for C$_{17}$H$_{15}$N$_3$: C, 78.13: H, 5.79; N, 18.08. Found C, 78.17; H, 5.68; N, 17.91.

Example 1(b) - Preparation of 2-(1-{6[ethyl-(2-{8-[4-(4-fluorophenyl)-4-oxobutyl]-4-oxo-1-phenyl-1,3,8-triazaspiro[4.5]dec-3-yl}ethyl)-amino]-2-naphthyl}ethylidene)malononitrile
In a 3 L two-neck round bottom flask, equipped with a reflux condenser and a dropping funnel, 2 L of hydrochloric acid (d = 1.16) were stirred and heated to boiling. A solution of 6.06 g (30.3 mmol) of 1-(6-methoxy-2-naphthyl)-1-ethanone (prepared as described in Arsenijevic et al., Org. Synth. Coll. 6:34 (1988), the disclosure of which is incorporated herein by reference) in a minimum amount of dichloromethane was added, and the mixture was stirred and heated at reflux for 2 hours. The hot solution was filtered through a mineral wool plug to remove oily residue. The solid that separated after cooling was filtered on a glass frit and dissolved in 130 mL of ethyl acetate. The solution was washed with brine, dried with anhydrous magnesium sulfate and evaporated to give 5 g (89 %) of 1-(6-hydroxy-2-naphthyl)1-ethanone.

A mixture of 1-(6-hydroxy-2-naphthyl)ethanone (744 mg, 3.92 mmol), sodium hydrogen sulfate(IV) (1.66 g, 16 mmol), 2-ethylaminoethanol (2 mL) and water (5 mL) was heated in a steel bomb at 130-140°C for 3 days. After cooling, the mixture was distributed between water and ethyl acetate, and the organic layer was washed with brine, dried and evaporated. The residue was dissolved in acetone and loaded onto a 4 mm dry silica plate for radial chromatography. The

1   plate was eluted with a 1:1 mixture of petroleum ether and ethyl acetate. Appropriate fractions
     were collected and evaporated to give 125 mg (12%) of 1-{6-[ethyl-(2-hydroxylethyl)-amino]-2-
     naphthyl}ethanone.

         A solution of 1-{6-[ethyl-(2-hydroxylethyl)-amino]-2-naphthyl}ethanone (125 mg, 0.486
5   mmol) in pyridine (3.5 mL) was cooled to -15°C and *p*-toluenesulfonic anhydride (252 mg, 0.81
     mmol) was added with stirring under argon. The reaction mixture was allowed to slowly warm
     up to the room temperature, and stirring was continued for 24 hours. Because TLC (silica, 10%
     ethyl acetate in petroleum ether) revealed that the starting material was still present, more
     p-toluenesulphonic anhydride (252 mg, 0.81 mmol) was added, and stirring was continued for an
10   additional 24 hours. The mixture was then cooled in an ice-water bath and distributed between
     brine and ether. The organic layer was dried and evaporated to leave an oily residue. The
     product, 6-acetyl-2-(ethyl-2-[(4-methylphenyl)-sulfonyloxy]-ethylamino)-naphthalene, was isolated
     by radial chromatography (1 mm silica, dichloromethane) in 30% yield. *HRMS* calcd. for
     $C_{23}H_{25}NO_4S$:411.1504. Found: 411.1514. ^{1}H NMR δ 1.25 (t, 3H, $CH_2\underline{CH}_3$), 2.33 (s, 3H, Ph-
15   $\underline{CH}_3$), 2.67 (s, 3H, $COCH_3$), 3.49 (q, 2H, $\underline{CH}_2CH3$), 3.75 (t, 2H, N$\underline{CH}$ ₂H ₂O), 4.25 (t, 2H,
     $NCH_2\underline{CH}_2O$), 6.97 (d, 1H, 5-H), 7.01 (dd, 1H, 7-H), 7.18 and 7.20 (d, 2H, 3'-H, 5'-H), 7.56 (d,
     1H, 4-H), 7.69 and 7.72 (d, 2H, 2'-H, 6'-H), 7.75 (d, 1H, 8-H), 7.93 (dd, 1H, 3-H), 8.29 (d, 1H,
     1-H). $J_{1,3}$ = 1.6 Hz, $J_{2',6}$ = $J_{3',5}$ = 8.5 Hz, $J_{7,5}$ = 2.5 Hz, $J_{7,8}$ = 9.2 Hz, $J_{3,4}$ = 8.7 Hz,
     $J_{(CH2CH3)}$ = 7.1 Hz, $J_{(NCH2CH2O)}$ = 6.2 Hz.
20   To a solution of sodium hydroxide (1g) and tetra-*n*-butylammonium hydrogensulfate (VI)
     (50 mg, 0.15 mmol) in water (2 mL), spiperone ketal (8-3[2-(4-fluorophenyl)-1,3-dioxolan-2-
     yl]propyl-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one (which can be prepared as described in U.S.
     Patent No. 3,839,342, Chem Abstr. 82:43416, and Kiesewetter et al., Appl. Radiat. Isot. 37:1181
     (1986), the disclosures of which are incorporated herein by reference) (15 mg, 0.034 mmol) was
25   added and vigorously stirred. After 10 minutes, a solution of 6-acetyl-2-(ethyl-2-[(4-
     methylphenyl)-sulfonyloxy-ethylamino)-naphthalene (12 mg, 0.03 mmol) in toluene (3 mL) was
     added, and the reaction mixture was stirred and heated at 90°C for 1 hour. After cooling, the
     reaction mixture was distributed between water and dichloromethane, and the organic layer was
     washed with brine, dried and evaporated to leave an oily residue. Radial chromatography (1 mm
30   silica, 2% methanol in dichlormethane) yielded 5 mg (25%) of 1-[6-(ethyl-2-[(8-3-[2-(4-
     fluorophenyl)-1,3-dioxolan-2-yl]-propyl-4-phenyl-2,4,8-triazaspiro[4.5]dec-1-en-1-yl)-oxy]-
     ethylamino)-2-naphthyl]1-ethanone (compound A) and 11 mg (56%) of 1-[6-(ethyl-[2-(8-3-[2-(4-
     fluorophenyl)-1,3-dioxolan-2-yl]-propyl-1-oxo-4-phenyl-2,4,8-triazaspiro[4.5]dec-2-yl)-
     ethyl]amino-2-naphthyl)-1-ethanone (compound B).

5   Example   1(c)   -   2-(1-6-[4-(8-[4-(4-Fluorophenyl)-4-oxobutyl]-1-oxo-4-phenyl-2,4,8-
triazaspiro[4.5]-dec-2-ylmethyl)-piperidino]-2-naphthylethylidene)-malononitrile

10
15
20
A mixture of 1-(6-hydroxy-2-naphthyl)-1-ethanone (653 mg, 3.5 mmol) (prepared as
described in Example 1(b)), sodium hydrogensulfate(IV) (1.6 g, 15.5 mmol), 4-piperidylmethanol
(2 g, 17.6 mmol) (prepared as described in Bradbury et al., J. Med. Chem. 34:1073 (1991), the
disclosure of which is incorporated herein by reference), and water (6 mL) was heated in a steel
25 bomb at 135-142°C for 16 days. After cooling, the reaction mixture was extracted with ethyl
acetate. Some product still remained in the residue, so it was further extracted with 5% methanol
in dichloromethane. Organic extracts were combined, dried and evaporated. The residue was
chromatographed by radial chromatography (2 mm silica, 2% methanol in dichloromethane) to
yield 139 mg (14%) of 1-6-[(4-hydroxymethyl)-piperidino]-2-naphthyl-1-ethanone. After
30 recrystallization from ethyl acetate the compound melted at 180-182°C. ^{1}H NMR: δ 1.44 (dddd,
2H, 3' a-H, 5'a-H), 1.76 (m, 1H, 4'a-H), 1.91 (bd, 2H, 3'e-H, 5'c-H), 2.68 (s, 3H, COCH$_3$), 2.89
(ddd, 2H, 2'a-H, 6'a-H), 3.58 (d, 2H, OCH$_2$), 3.94 (bd, 2H, 2'e-H, 6'e-H), 7.10 (d, 1H, 5-H),
7.32 (dd, 1H, 7-H), 7.66 (d, 1H, 4-H), 7.80 (d, 1H, 8-H), 7.94 (dd, 1H, 3-H), 8.32 (d, 1H, 1-H)
$J_{3'a,3'e}=J_{5'a,5'e}=12.5$ Hz, $J_{2'a,3'a}=J_{6'a,5'a}=12.5$ Hz, $J_{3'a,4'a}=J_{5'a,4'a}=12.5$ Hz,
35 $J_{2'e,3'a}=J_{6'e,5'a}=4.0$ Hz, $J_{2'a,2'c}=J_{6'a,6'e}=12.5$ Hz, $J_{2'a,3'e}=J_{6'a,5e}=2.6$ Hz, $J_{4a,OCH2}=6.4$ Hz,
$J_{1,3}=1.9$ Hz, $J_{3,4}=8.9$ Hz, $J_{5,7}=2.3$ Hz, $J_{7,8}=9.0$ Hz.

A solution of 1-6-[(4-hydroxymethyl)-piperidino]-2-naphthyl-1-ethanone (59 mg, 0.2 mmol)
in pyridine (3 mL) was cooled to -15°C, and p-toluenesulfonic anhydride (205 mg, 0.6 mmol) was

1   added with stirring under argon. The reaction mixture was allowed to slowly warm up to the
room temperature during 1 hour. It was cooled again and distributed between brine and ether.
The organic layer was washed with brine, dried and evaporated to leave 83 mg (91%) of raw 1-(6-
acetyl-2-naphthyl)-4-[(4-methylphenyl)-sulfonyloxy]-methylpiperidine.

5   To a solution of sodium hydroxide (1 g) and tetra-n-butylammonium hydrogen-sulfate(VI)
(50 mg, 0.15 mmol) in water (2 mL), spiperone ketal (100 mg, 0.2 mmol) was added and
vigorously stirred. After 10 minutes, a solution of 1-(6-acetyl-2-naphthyl)-4-[(4-methylphenyl)-
sulfonyloxy]-methylpiperidine (98 mg, 0.2 mmol) in toluene (10 mL) was added, and the reaction
mixture was stirred at room temperature for 11 days. The reaction mixture was distributed

10   between brine and dichloromethane, and the organic layer was dried and evaporated to leave 190
mg of an oily residue. Radial chromatography (1 mm silica, dichloromethane followed by 2%
methanol in dichloromethane) yielded 27 mg (17%) of 1-[6-(4-[(8-3-[2-(4-fluorophenyl)-1,3-
dioxolan-2-yl]-propyl-4-phenyl-2,4,8-triazaspiro[4.5]dec-1-en-1-yl)-oxyl-methylpiperidino)-2-
naphthyl]-1-ethanone (compound 3) and 92 mg (58%) of 1-(6-4-[(8-3-[2-(4-fluorophenyl)-1,3-

15   dioxolan-2y-1]-propyl-1-oxo-4-phenyl-2,4,8-triazaspiro[4.5]dec-2-yl)-methyl]-piperidino-2-
naphthyl)-1-ethanone (compound 4).

Hz.

35   Using the procedure described in Example 1(b) for the synthesis of 2-[1-(6-ethyl-[2-(8-3-[2-
(4-fluorophenyl)-1,3-dioxolan-2-yl]-propyl-1-oxo-4-phenyl-2,4,8-triazoaspiro[4.5]dec-2-yl)-ethyl]-
amino-2-naphthyl)-ethylidene]-malonitrile,   1-(6-4-[(8-3-[2-(4-fluorophenyl)-1,3-dioxolan-2y-1]-
propyl-1-oxo-4-phenyl-2,4,8-triazaspiro[4.5]dec-2-yl)-methyl]-piperidino-2-naphthyl)-1-ethanone

-14-

was transformed into 2-[1-(6-4-[(8-3-[2-(4-fluorophenyl)-1,3-dioxolan-2y-l]-propyl-1-oxo-4-phenyl-2,4,8-triazaspiro[4.5]dec-2-yl)-methyl]-piperidino-2-naphthyl)-ethylidene]malonitrile. It was purified by radial chromatography on a 1 mm silica plate using 2% MeOH in CH_2Cl_2 as the solvent. FAB HRMS calcd. for $C_{46}H_{50}FN_6O_3$ (M+H): 753.3928. Found: 753.3940. ^{1}H NMR δ 1.60 - 2.1 (m, 11H, spiperone, 3'a-H, 3'e-H, 4'a-H, 5'a-H, 5'e-H), 2.40 (m, 2H, spiperone), 2.71 (s, 3H, C=CCH$_3$), 2.60 - 2.80 (m, 6H, spiperone), 2.91 (m, 2H, 2'a-H, 6'a-H), 3.37 (d, 2H, 4'-CH2N), 3.75 (m, 2H, OCH$_2$CH$_2$O), 3.94 (bd, 2H, 2'e-H, 6'e-H), 4.02 (m, 2H, OCH$_2$CH$_2$O), 4.72 (s, 2H, NCH$_2$N), 6.85 - 6.95 (m, 3H, Ph), 7.01 (m, 2H, fluorophenyl), 7.07 (d, 1H, 5-H), 7.31 (m, 3H, 7-H, Ph), 7.41 (m, 2H, fluorophenyl), 7.56 (dd, 1H, 3-H), 7.69 (d, 1H, 4-H), 7.77 (d, 1H, 8-H), 8.01 (d, 1H, 1-H), $J_{2'a,3'a}=J_{5'a,6'a}=12.8$ Hz, $J_{2'a,2'e}=J_{6'a,6'e}=12.8$ Hz, $J_{4'a,4'-CH2N}=7.6$ Hz, $J_{1,3}=1.8$ Hz, $J_{3,4}=8.6$ Hz, $J_{5,7}=2.2$ Hz, $J_{7,8}=9.4$ Hz, $J_{2'a,3'e}=J_{5'e,6'a}=1.8$ Hz, $J_{H,F}=8.7$ and 6.2 Hz.

The ketal protective group was removed, as described in Example 1(b), to give 2-(1-6-[4-(8-[4-(4-fluorophenyl)-4-oxobutyl]-1-oxo-4-phenyl-2,4,8-triazaspiro[4.5]-dec-2-ylmethyl)-piperidino]-2-naphthylethylidene)-malononitrile in a quantitative yield. *FAB HRMS* calcd. for $C_{44}H_{46}FN_6O_2$ (M+H): 709.3666. Found: 709.3689. ^{1}H NMR δ 1.60-2.1 (m, 11H, spiperone, 3'a-H, 3'e-H, 4'a-H, 5'a-H, 5'e-H), 2.5-2.71 (m, 4H, spiperone), 2.73 (s, 3H, C=C-CH$_3$), 2.8-3.1 (m, 6H, spiperone, 2'a-H, 6'a-H), 3.38 (d, 2H, 4'-CH$_2$N), 3.96 (bd, 2H, 2'e-H, 6'e-H), 4.74 (s, 2H, NCH$_2$N), 6.91 (m, 3H, phenyl), 7.1 (d, 1H, 5-H), 7.15 (m, 2H, fluorophenyl), 7.24-7.30 (m,2H, Ph), 7.34 (dd, 1H, 7-H), 7.58 (dd, 1H, 3-H) 7.72 (d, 1H, 4-H), 7.79 (d, 1H, 8-H), 8.01-8.08 (m, 3H, fluorophenyl, 1-H). $J_{1,3}=2.0$ Hz, $J_{3,4}=8.6$ Hz, $J_{5,7}=2.4$ Hz, $J_{7,8}=9.2$ Hz, $J_{4'a,4'-CH2N}=7.4$ Hz,, $J_{2'a,2'e}=J_{6'a,6'e}=13.0$ Hz, $J_{2'a,3'a}=J_{5'a,6'a}=12.5$ Hz, $J_{2'a,3'e}=J_{5'e,6'a}=1.9$ Hz, $J_{H,F}=8.7$ and 6.2 Hz.

Example 1(d) - Preparation of *tert*-Butyl-4-(6-acetyl-2-naphthyl)-1-piperazinecarboxylate
Anhydrous piperazine (7g, 81.3 mmol; dried in a vacuum desiccator over KOH-drierite mixture for 3 days) was dissolved in a mixture of dry, freshly distilled toluene and hexamethyl phosphoric amide (HMPA), 25 mL each. To the solution was added 556 mg (80.1 mmol) of lithium rod, cut in small pieces under argon atmosphere, and the mixture was stirred under argon for 24 hours, during which time all lithium has dissolved. Vacuum-dried 1-(6-methoxy-2-naphthyl)-1-ethanone (prepared as described in Arsenijevic et al., Org. Synth. Coll. 1988 6:34-36,

the disclosure of which is incorporated herein by reference) (3.5 g, 17.5 mmol) was added. and stirring was continued for additional 65 hours. After quenching with 300 mL of water, extraction with dichloromethane (3x300 mL), drying with anhydrous magnesium sulfate, and evaporation, a mixture of white and yellow solids was obtained. Extraction with 300 mL of hot methanol gave raw product, 1-(6-piperazino-2-naphthyl)-1-ethanone, which was purified by column chromatography (70-230 mesh silica, 25x120 mm, 5% methanol in dichloromethane). The yield was 1.54 g (35 %). After recrystallization from ethyl acetate, the sample melted at 170.5-172°C.

1-(6-piperazino-2-naphthyl)-1-ethanone was also prepared by heating 1-(6-hydroxy-2-naphthyl)-1-ethanone (prepared as described in Example 1(b)) (441 mg, 2.36 mmol) at 140-150°C with 6 g piperazine hydrate (30.9 mmol) and 244 mg (2.35 mmol) $NaHSO_3$ for 24 hours. Additional sodium bisulfite (2 g, 19.2 mmol) was added. After an additional 24 hours, more bisulfite (1 g) was added, and heating was continued (total reaction time 72 hours). After cooling, the mixture was extracted with 2x50 mL methanol. The residue after evaporation of methanol was suspended in 50 mL water and extracted with ethyl acetate (5 x 80 mL). Combined extracts were dried (magnesium sulfate) and evaporated to give 430 mg of yellow solid. Radial chromatography (4 mm silica, methanol) gave 83 mg (19 %) of starting naphthol and 276 mg (46%; 56%, based on unrecovered starting material) of 1-(6-piperazino-2-naphthyl)-1-ethanone. The 1-(6-piperazino-2-naphthyl)-1-ethanone was in all respects identical with the compound obtained using the alternative method described above. Anal. calculated for $C_{16}H_{18}N_2O$: C, 75.56; H, 7.13; N, 11.01. Found: C, 75.82; H, 7.27; N, 10.92. ^{1}H NMR: δ 2.68 (s, 3H, CH_3), 3.09 and 3.35 (t, J = 4.95 Hz, 8H, piperazine), 7.10 (d, 1H, 5-H), 7.31 (dd, 1H, 7-H), 7.69 (d, 1H, 4-H), 7.83 (d, 1H, 8-H), 7.95 (d, 1H, 3-H), 8.34 (s, 1H, 1-H); $J_{5,7}$= 2 Hz, $J_{7,8}$= 8.4 Hz, $J_{1,3}$= 2 Hz, $J_{3,4}$= 8.4 Hz.

1-(6-piperazino-2-naphthyl)-1-ethanone (254 mg, 1 mmol) was added to a stirred mixture of 1 g NaOH, 100 mg tetra-*n*-butylammonium hydrogensulfate, 2 mL water and 6 mL toluene, followed by a solution of 230 mg (1.05 mmol) of di-*tert*-butyl dicarbonate. The course of the reaction was followed by TLC (silica, 5% methanol in dichloromethane). Every 10 minutes an additional amount of the dicarbonate was added until all starting material had reacted. A total of approximately 1.5 equivalents were used. A mixture of water and dichloromethane (60 mL each) was added, and, after thorough shaking, the layers were separated. The aqueous layer was extracted with an additional 30 mL of dichloromethane. The combined organic extracts were dried with anhydrous magnesium sulfate. During this procedure, the color of the solution turned from pink to light yellow. Evaporation *in vacuo* gave 295 mg (83%) of *tert*-butyl-4-(6-acetyl-2-naphthyl)-1-piperazinecarboxylate, which, on recrystallization from dichloromethane-petroleum ether mixture, melted at 153-154°C. Anal. Calculated for $C_{21}H_{26}N_2O_3$: C, 71.16; H, 7.39; N, 7.90. Found: C, 71.27; H, 7.60; N, 7.86. ^{1}H NMR: δ 1.50 (s, 9H, -$C(CH_3)_3$), 2.68 (s, 3H, CH_3), 3.33 and 3.64 (t, J= 4.9 Hz, 8H, piperazine), 7.10 (d, 1H, 5-H), 7.31 (dd, 1H, 7-H), 7.70 (d, 1H,

1   4-H), 7.85 (d, 1H, 8-H), 7.97 (d, 1H, 3-H), 8.35 (d, 1H, 1-H); $J_{5,7}$= 2 Hz, $J_{7,8}$= 9 Hz, $J_{3,4}$= 8.7
Hz.

Example 1(e) - Preparation of 2-[1-(6-piperazino-2-naphthyl)ethylidene]malononitrile

5

10
tert-Butyl 4-(6-acetyl-2-naphthyl)-1-piperazinecarboxylate (177 mg, 0.5 mmol), prepared
as described in Example 1(d), was heated with 40 mg (0.6 mmol) of malononitrile in 4 mL
pyridine at 105-110°C. After 5.5 hours, an additional 24 mg of malononitrile was added, and
heating was continued for a total of 12 hours and 40 minutes. The mixture was cooled and
15   evaporated *in vacuo*. Polar components of the mixture were removed by column chromatography
(70-230 mesh silica, ϕ20x120 mm, chloroform), and the product, *tert*-butyl-4-[6-(2,2-dicyano-1-
methylvinyl)-2-naphthyl]-1-piperazinecarboxylate, was finally purified by radial chromatography
(silica, 2 mm, chloroform).   155 mg (77%) of *tert*-butyl-4-[6-(2,2-dicyano-1-methylvinyl)-
2-naphthyl]-1-piperazinecarboxylate   were   obtained,   which,   after   recrystallization   from
20   dichloromethane - petroleum ether mixture, melted at 169-171°C.   *Anal.*   Calculated for
$C_{24}H_{26}N_4O_2$: C, 71.62; H, 6.51; N, 13.92. Found: C, 71.62; H, 6.66; N, 13.87. ^{1}H NMR: δ 1.50
(s, 9H, -C(CH$_3$)$_3$), 2.72 (s, 3H, CH$_3$), 3.34 and 3.64 (t, J = 5.1 Hz, 8H, piperazine), 7.09 (d, 1H,
5-H), 7.33 (dd, 1H, 7-H), 7.58 (dd, 1H, 3-H), 7.74 (d, 1H, 4-H), 7.81 (d, 1H, 8-H), 8.02 (d, 1H,
1-H); $J_{5,7}$ = 2 Hz, $J_{7,8}$ = 9.1 Hz, $J_{1,3}$ = 2 Hz, $J_{3,4}$ = 9.1 Hz.

25   When *tert*-butyl-4-[6-(2,2-dicyano-1-methylvinyl)-2-naphthyl]-1-piperazinecarboxylate was
treated with TFA (trifluoroacetic acid) at room temperature, TLC showed that the reaction was
over   in   5   minutes   and   gave   a   single   product,   2-[1-(6-piperazino-2-
naphthyl)ethylidene]malononitrile. The TFA was removed *in vacuo* at room temperature. [1]H
NMR: δ 2.72 (s, 3H, CH$_3$), 3.50 and 3.63 (broad, 8H, piperazine), 7.18 (broad s, 1H, 5-H), 7.29
30   (d, 1H, 7-H), 7.59 (d, 1H, 3-H), 7.79 (d, 1H, 4-H), 7.87 (d, 1H, 8-H), 8.04 (s, 1H, 1-H), 9.0
(broad, 1.5H, NH and acid); $J_{7,8}$ = 8.8 Hz, $J_{3,4}$ = 8.4 Hz. ^{19}F NMR: δ -76.2 (CF$_3$COO).

NMR of the residue revealed that the *tert*-butyloxycarbonyl group has been removed and
that there was some TFA left (^{19}F NMR). Dichloromethane (10 mL) was added and the solution
was washed with saturated NaHCO$_3$ solution, dried, and evaporated *in vacuo*. A light yellow oil
35   was obtained, which, on standing at room temperature, turned dark red. TLC showed that the
change in color is due to decomposition of 2-[1-(6-piperazino-2-naphthyl)ethylidene]malononitrile
into several products, the most intense spot being low-R$_f$ red-orange. Selected ^{1}H NMR signals

1   after neutralization: δ 2.72 (s, 3H, CH$_3$), 3.09 and 3.35 (t, J = 5 Hz, 8H, piperazine), 7.08 (s, 1H, 5-H), 8.02 (s, 1H, 1-H).

Example 1(f) - Preparation of 2-(1,1-dicyanopropen-2-yl)-6-(2-[^{18}F]-fluoroethyl)-methylamino)-
5   naphthalene ([F-18]FDDNP)

10
A mixture of 4.15 g (55.5 mmol) NaHSO$_3$, 8 mL of water, 0.78 g (4.19 mmol) of 1-(6-
15   hydroxy-2-naphthyl)-1-ethanone (prepared as described in Example 1(b)), and 8 mL of 2-methylaminoethanol was heated and stirred in a steel bomb at 140°C for 28 hours. After cooling, the mixture was distributed between ethyl acetate and water (500 mL and 200 mL, respectively). The organic layer was dried and evaporated to leave raw 1-(6-(2-hydroxyethyl-methylamino)-2-naphthyl)-1-ethanone (0.749 g, 73%) of which was further purified by radial chromatography (4
20   mm SiO$_2$, CH$_2$Cl$_2$).

To a solution of 201 mg (0.83 mmol) of 1-(6-2-hydroxyethyl-methylamino-2-naphthyl)-1-ethanone in pyridine (6 mL), malononitrile (236 mg, 3.6 mmol) was added and the mixture was heated at 95°C for 24 hours. The solvent was removed in vacuo, and the residue was chromatographed by radial chromatography (4 mm SiO$_2$ 1% MeOH/CH$_2$Cl$_2$) to give 150 mg
25   (73%) of 2-(1,1-dicyanopropen-2-yl)-6-2-hydroxyethyl)-methyl-amino)-naphthalene.

To the solution of 2-(1,1-dicyanopropen-2-yl)-6-(2-hydroxyethyl)-methylamino)-naphthalene (120 mg, 0.41 mmol) in pyridine (5 mL), p-toluensulfonic anhydride was added (441 mg, 1.35 mmol). After stirring at room temperature for 1 hour, pyridine was removed under vacuum, and the residue was chromatographed by radial chromatography (2 mm SiO$_2$, CH$_2$Cl$_2$) to give 183
30   mg (80%) of 2-(1,1-dicyanopropen-2-yl)-6-(2-tosyloxyethyl)-methylamino-naphthalene.

Radioactive ^{18}F-fluoride 528.5mCi from the cyclotron was transferred into a solution of 19 mg of Kryptofix 2.2.2 and 0.75 mg potassium carbonate in 50 μL of water and 300 μL of acetonitrile. Water was removed in a stream of nitrogen at 115°C followed by codistillation with acetonitrile (3 x 200 μL). The tosylate (2-(1,1-dicyanopropen-2-yl)-6-(2-tosyloxyethyl)-
35   methylamino)-naphthalene, 4 mg) in 1 mL of acetonitrile was added, and the mixture was heated at 85-86°C for 20 minutes. After cooling, 1 mL of water was added, and the mixture was transferred onto a C-18 Sep-Pak Cartridge, washed with distilled water (3 x 4 mL) and eluted with CH$_2$Cl$_2$ (2 x 2.5 mL). Eluate was dried by passing through a column packed with sodium sulfate

1   and loaded onto a HPLC column (Whatman Partisil Silica 10, 500 x 10 mm, mL/min CH_2Cl_2 :
      hexane = 7 : 3, UV detector @ 254 nm, radioactivity detector). Eluate was collected, appropriate
      fractions were combined, evaporated under vacuo to yield 50.7m Ci (17%, corrected for decay)
      of the titled product which was formulated for injection. The synthesis was complete in 50
5   minutes.

      <u>Example 2</u>

            Detection and labeling of β-amyloid plaques *in vitro* and *in vivo*, using brain tissue sections·
      and rat brains, were conducted using the following procedures.

10   A 2.1 mg/mL DDNP stock solution was prepared, which was adjusted to 8mM in 100%
      ethanol. A DDNP working solution was prepared by diluting the stock solution with distilled
      water in a ratio of 1:100-1000 (stock solution:distilled water).

            β-amyloid 250 μM (1.25 mg/mL in distilled water) was aggregated at 37°C for 48 hours.
      5 μL were smeared on slides, air-dried and then rehydrated with distilled water. Alternatively,
15   Aβ-positive brain tissue sections were rehydrated with distilled water. DDNP working solution
      was applied to each slide for 30 minutes at room temperature. The slides were washed three times
      for five minutes with distilled water. The slides were coverslipped with fluorescent protectant
      mounding media (Vectashield™, available Vector Labs., Burlingame, California) and observed
      under a fluorescence microscope with a thioflavin S or FITC filter.

20   β-amyloid 250 μM (1.25 mg/mL in distilled water) was aggregated at 37°C for 48 hours
      to produce fibrils confirmed by smears. Three rats were anesthetized. 3 μL of a solution of Aβ
      fibrils (1.25 μg/μL) were injected unilaterally into the cortex of each rat (Bregma 0, AP-4.1mm,
      ML + 2.0 mm, DV-3.1mm). Then 3 μL of phosphate buffered saline (PBS) were injected into
      the contralateral side of each rat brain as a vehicle control. After injection, the needle remained
25   for 5 minutes to prevent reflux, and then the cranial hole was sealed with bone wax. Eight days
      after β-amyloid injection into the rat brains, the rats were injected with 10 microliters of DDNP
      working solution (320 micromolar) prepared by diluting DDNP stock solution into 1.5% BSA
      (bovine serum albumin) in phosphate buffered saline, pH 7.2).

            After one hour, the rats were cardiac perfused with PLP fixative (4% paraformaldehyde,
30   1% lysin in 0.05 M phosphate buffer, pH 7.4). Additional immersion fixation of rat brain was
      at 4°C overnight with PLP fixative. The rat brains were washed with PBS, saturated in 10 and
      20% sucrose, and snap frozen in chilled isopentane (-70°C) with liquid nitrogen. The brains were
      cryostat sectioned at 10 μM around the needle-track and directly coverslipped with glycerol and
      fluorescence protectant (Vectashield™). The brain sections were observed with a fluorescence
35   microscope.

            FIGs. 1A to 1F depict amyloid plaques labeled in sections from brain of an AD patient and
      a transgenic mouse, demonstrating that DDNP is able to label amyloid plaques. FIGs. 2A to 2E
      depict labeled β-amyloid plaques, demonstrating that DDNP passes the blood brain barrier in rats.

1   It was found that DDNP readily labeled amyloid deposits in cryostat and paraffin sections
of AD brain tissue with a level of sensitivity similar to thioflavin S. Use of DDNP has several
advantages over thioflavin S. Namely, the use of DDNP requires no pretreatments and, unlike
thioflavin S, works with minimal washing and without formalin or paraformaldehyde fixation or

5   differentiation of tissue. Stock solution can be kept in the freezer for six months and still produce
acceptable results at 1/100 to 1/1,000 dilutions, eliminating the need to make the stock up fresh,
as is required for thioflavin S labeling.

Example 3

10   Labeling of human β-amyloid plaques and neurofibrillary tangles *in vivo* were conducted
using the following procedures.

A patient was placed in a tomograph to obtain brain dynamic PET images. 8.0 mCi of 2-
(1.1-dicyanopropen-2-yl)-6-(2-[^{18}F]-fluoroethyl)-methylamino)-naphthalene   ([F18]FDDNP)
(specific activity: 5-12 Ci/micromol; mass: ~ 1 nanomol), prepared as described in Example 1(f),

15   were injected intravenously into the arm of the patient. Dynamic acquisition data of brain
images were recorded simultaneously in forty-seven brain planes for two hours.

It was found that [F-18]FDDNP readily crosses the brain blood barrier and labels brain
structures in a manner consistent with the presence of beta amyloid plaques and neurofibrillary
tangles. The patient had previously had ^{18}F-fluorodeoxyglucose (FDG)/positron emission

20   tomography (PET) scans, as well as MRI scans to monitor brain atrophy. In areas where the
maximum atrophy was observed in the MRI scans (low temporal and parietal lobes), maximum
accumulation of the[F-18]FDDNP label was observed. In those areas, low glucose metabolism
(as measured with FDG/PET scans) was also observed.

25   Example 4

Labeling and detection of human β-amyloid plaques and neurofibrillary tangles *in vivo*
were conducted using the following procedures. Ten human subjects, seven Alzheimer's
diseased patients (ages 71 to 80) and three control patients (ages 62 to 82) were studied. The
patients were positioned supine in an EXACT HR + 962 tomograph (Siemens-CTI, Knoxville,

30   Tennessee) with the imaging plane parallel to the orbito-meatal line. Venous catheterization was
performed, and then [F-18]FDDNP (5-10mCi) in human serum albumin (25%) was
administered as a bolus via the venous catheter. Sequential emission scans were obtained
beginning immediately after [F-18]FDDNP administration using the following scan sequence:
six 30 second scans, four 3 minute scans, five 10 minute scans, and three 20 minute scans.

35   Rapid venous blood sampling was performed via the indwelling catheter in two subjects for
input function determination and plasma metabolite analysis.

Figure 3A provides a PET-[F-18]FDDNP (2-(1.1-dicyanopropen-2-yl)-6-(2-[^{18}F]-
fluoroethyl)-methylamino)-naphthalene) image of a brain cross-section through the

1   hippocampus-amygdala-entorhinal/temporal cortex region of an Alzheimer's disease patient.
       The image was reconstructed from scanning data obtained 30 to 60 minutes post [F-18]FDDNP
       injection. Co-registered PET-FDG (FDG is 2-[F-18]fluoro-2-deoxy-D-glucose) and MRI (proton
       relaxation times) images of the patient are also shown, in Figures 3B and 3C, respectively, to

5   provide information about glucose metabolism and anatomical structures on the cross-section,
       respectively. The medial temporal region appears darker in the [F-18]FDDNP scan (slower
       clearance) and lighter in the FDG scan (reduced glucose metabolism).

               Figure 4 demonstrates that estimated residence times of [F-18]FDDNP in Alzheimer's
       diseased patients are seen to be different from values in control patients. The residence time

10   shown is in reference to that in the pons, an area known to have limited involvement in
       Alzheimer's disease pathology. The residence time was calculated from the clearance rates of
       the tracer in affected regions of interest (ROI) and in the pons as:

       Residence time = [1/clearance rate for affected ROI] − [1/clearance rate for pons]

15

       Separate ROIs were defined in entorhinal cortex, hippocampus, lateral temporal cortex and
       pons. The region with the slowest clearance rate was used as the affected ROI in the
       calculation of the residence time shown in Figure 4.

               It was found that after intravenous injection, [F-18]FDDNP crosses the blood brain barrier

20   readily in proportion to blood flow. Accumulation of radioactivity was followed by the differential
       regional clearance of [F-18]FDDNP. A slower clearance was observed in brain areas reliably
       known to accumulate β-amyloid plaques and neurofibrillary tangles, specifically the hippocampus-
       amygdala-entorhinal complex, as well as temporal and parietal cortex in more advanced states of the
       disease. rCMRGl measured with PET in these subjects were also consistent with the expected β-

25   amyloid plaque load and the possible presence of neurofibrillary tangles. In these patients, brain areas
       with low glucose metabolism were in general matched with high retention of [F-18]FDDNP. The
       hippocampus-amygdala-entorhinal cortex presented high retention of activity ([F-18]FDDNP) in
       most cases, even in patients with low severity of symptoms. A normal 82 year old volunteer
       presented deposition of activity in the hippocampus-amygdala-entorhinal complex in a PET study

30   with [F-18]FDDNP, and low rCMRGl in the same areas, as measured with FDG, as shown in Figure
       4. These results are consistent with observations that elderly individuals without apparent signs of
       dementia may present neurofibrillary pathology in the second layer of neurons of the entorhinal
       cortex and plaques in the hippocampal formation. Increased severity of symptoms was always
       accompanied with increased retention of activity, and slow clearance from temporal, parietal or

35   frontal cortex, in agreement with expected Aβ and neurofibrillary tangles deposition in these areas.

               In vitro autoradiography using [F-18]FDDNP with brain specimens of Alzheimer diseased
       patients also demonstrated a distribution of activity consistent with the presence of β-amyloid
       plaques and neurofibrillary tangles. Binding was observed in hippocampus, temporal and parietal

1   cortex matching results with immunostaining Aβ and tau antibodies. Since DDNP and its
derivatives are fluorescent, an evaluation of the ability of [F-18]FDDNP to label β-amyloid
plaques and neurofibrillary tangles *in vitro* was also performed with the same brain specimens. In
all Alzheimer's disease brain specimens, excellent visualization of neurofibrillary tangles, amyloid

5   peptides, and diffuse amyloid was produced with both DDNP and [F-18]FDDNP, matching results
with thioflavin S (24) obtained with the same samples.

In Figure 5, the central image was obtained by immunostaining a forty five micrometer
cryostate temporal cortex section of an Alzheimer's disease patient incubated with AT8 (anti-
phosphotau) and 10G4 (anti-AB1-15) at 1:800. Insets are adjacent sections of the same Alzheimer's

10   disease brain specimen stained with FDDNP. Images were generated using fluorescent scanning
microscopy. Green arrows indicate approximate origin of inset with reference to central
immunostaining section. Beginning in upper left corner and moving clockwise, the insets show (1)
neuritic plaques, (2) diffuse plaque, (3) vascular amyloid, (4) dense plaques and tangles, and (5)
dense tangles.

15

This invention in its broader aspect is not limited to the specific details shown and
described herein. Departures from such details may be made without departing from the
principles of the invention and without sacrificing its chief advantages.

25

30

35

1   We claim:

1.   A method for labeling structures selected from the group consisting of β-amyloid plaques and neurofibrillary tangles either *in vivo* or *in vitro*, comprising contacting

5   brain tissue, with a compound of formula (I):

wherein:

R_1 is selected from the group consisting of -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)O-alkyl, -C(O)O-alkylenyl-R_4, -C=C(CN)$_2$-alkyl, -C=C(CN)$_2$-alkylenyl-R_4,

15   ;

wherein

R_4 is a radical selected from the group consisting of alkyl, substituted

20   alkyl, aryl and substituted aryl;

R_5 is a radical selected from the group consisting of -NH$_2$, -OH, -SH, -NH-alkyl, -NHR$_4$, -NH-alkylenyl-R_4, -O-alkyl, -O-alkylenyl-R_4, -S-alkyl, and -S-alkylenyl-R_4;

R_6 is a radical selected from the group consisting of -CN, -COOH,

25   -C(O)O-alkyl,   -C(O)O-alkylenyl-R_4,   -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)-halogen, -C(O)NH$_2$, -C(O)NH-alkyl, -C(O)NH-alkylenyl-R_4;

R_7 is a radical selected from the group consisting of O, NH, and S; and R_8 is N, O or S; and

30   R_2 and R_3 are each independently selected from the group consisting of alkyl and alkylenyl-R_{10}, wherein R_{10} is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal, and spiperone-3-yl,

or R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs,

35   halogen, alkyl-R_5, carbonyl, spiperone, spiperone ketal and spiperone-3-yl, and further wherein one or more of the hydrogen, halogen or carbon atoms are optionally replaced with a radiolabel.
2.   A method according to claim 1, wherein the compound of formula (I) is radiolabeled with ^{18}F or ^{123}I.

3.   A method for labeling structures selected from the group consisting of β-amyloid plaques and neurofibrillary tangles either *in vivo* or *in vitro*, comprising contacting brain tissue, with a compound of formula (II):
wherein

R_2 and R_3 are each independently selected from the group consisting of alkyl and alkylenyl-R_{10}, wherein R_{10} is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal and spiperone-3-yl,

or R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs, halogen, alkylenyl-R_{10}, carbonyl, spiperone, spiperone ketal and spiperone-3-yl,

and R_9 is an alkyl, aryl and substituted aryl;

and further wherein one or more of the hydrogen, halogen or carbon atoms are optionally replaced with a radiolabel.

4.   A method according to claim 3, wherein the compound of formula (II) is radiolabeled with ^{18}F or ^{123}I.

5.   A method according to claim 1, wherein the compound of formula (I) is 2-(1,1-dicyanopropen-2-yl)-6-dimethylaminonaphthalene, optionally containing a radiolabel.

6.   A method according to claim 5, wherein the 2-(1,1-dicyanopropen-2-yl)-6-dimethylaminonaphthalene is radiolabeled with ^{18}F or ^{123}I.

7.   A method according to claim 1, wherein the compound of formula (I) is 2-(1,1-dicyanopropen-2-yl)-6-(2-ethyl)-methylamino)-naphthalene, optionally containing a radiolabel.

8.   A method according to claim 1, wherein the compound of formula (I) is 2-(1,1-dicyanopropen-2-yl)-6-(2-[^{18}F]-fluoroethyl)-methylamino)-naphthalene.

-24-

1   9.   A method according to claim 1, further comprising determining whether the structures are labeled by observing the brain tissue with a fluorescence microscope.

           10.   A method according to claim 1, wherein the compound according to claim 1 is
5   radiolabeled.

           11.   A method according to claim 10, further comprising determining whether the structures are labeled by observing the brain tissue by a method capable of detecting and depicting the distribution of the radiolabeled compound within the body.

10
           12.   A method according to claim 11, wherein the brain tissue is observed using positron emission tomography.
           13.   A method for diagnosing Alzheimer's disease in a patient, comprising:
15   injecting into brain tissue of the patient a compound of formula (I):

(I)

20

                                                              wherein:
           R_1 is selected from the group consisting of -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)O-alkyl, -C(O)O-alkylenyl-R_4, -C=C(CN)$_2$-alkyl, -C=C(CN)$_2$-alkylenyl-R_4,

25   and   ;

       wherein
                   R_4 is a radical selected from the group consisting of alkyl, substituted
30   alkyl, aryl and substituted aryl;
                   R_5 is a radical selected from the group consisting of -NH$_2$, -OH, -SH,
                       -NH-alkyl, -NHR$_4$, -NH-alkylenyl-R_4, -O-alkyl, -O-alkylenyl-R_4,
                       -S-alkyl, and -S-alkylenyl-R_4;
                   R_6 is a radical selected from the group consisting of -CN, -COOH,
35   -C(O)O-alkyl,   -C(O)O-alkylenyl-R_4,   -C(O)-alkyl,
                       -C(O)-alkylenyl-R_4, -C(O)-halogen, -C(O)NH$_2$, -C(O)NH-alkyl,
                       -C(O)NH-alkylenyl-R_4;
 R_7 is a radical selected from the group consisting of O, NH, and S; and

1   R_8 is N, O or S; and

R_2 and R_3 are each independently selected from the group consisting of alkyl and alkylenyl-R_{10}, wherein R_{10} is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal, and spiperone-3-yl,
5   or R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs, halogen, alkyl-R_{10}, carbonyl, spiperone, spiperone ketal and spiperone-3-yl,

and further wherein one or more of the hydrogen, halogen or carbon atoms are optionally replaced with a radiolabel; and

10   determining whether the compound of formula (I) labeled structures selected from the group consisting of β-amyloid plaques and neurofibrillary tangles.

14.   A method according to claim 13, wherein the compound of formula (I) is radiolabeled with ^{18}F or ^{123}I.

15

15.   A method according to claim 13, wherein the compound of formula (I) is a compound of formula (II):

20

(II)

wherein

25   R_2 and R_3 are each independently selected from the group consisting of alkyl and alkylenyl-R_{10}, wherein R_{10} is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal and spiperone-3-yl,

or R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs, halogen,

30   alkylenyl-R_{10}, carbonyl, spiperone, spiperone ketal and spiperone-3-yl,

and R_9 is an alkyl, aryl and substituted aryl.

16.   A method according to claim 15, wherein the compound of formula (II) is

35   radiolabeled with ^{18}F or ^{123}I.

17.   A method according to claim 13, wherein the compound of formula (1) is (2-(1.1-dicyanopropen-2-yl)-6-(2-[^{18}F]-fluoroethyl)-methylamino)-naphthalene).

-26-

1   18.   A method according to claim 13, wherein the determining step comprises observing the brain tissue by a method capable of detecting and depicting the distribution of the radiolabeled compound within the body.

5   19.   A method according to claim 13, wherein the brain tissue is observed using positron emission tomography (PET).

             20.   A method according to claim 13, wherein the brain tissue is observed using single photon emission computed tomography (SPECT).

10

             21.   A method for labeling β-amyloid plaques, either *in vivo* or *in vitro*, comprising contacting brain tissue, with a compound of formula (I):

15

                                                                wherein:
             R_1 is selected from the group consisting of -C(O)-alkyl, -C(O)-alkylenyl-R_4,
20   -C(O)O-alkyl, -C(O)O-alkylenyl-R_4, -C=C(CN)$_2$-alkyl, -C=C(CN)$_2$-alkylenyl-R_4,

25   wherein
                    R_4 is a radical selected from the group consisting of alkyl, substituted, alkyl, aryl and substituted aryl;
                    R_5 is a radical selected from the group consisting of -NH$_2$, -OH, -SH, -NH-alkyl, -NHR$_4$, -NH-alkylenyl-R_4, -O-alkyl, -O-alkylenyl-R_4, -S-alkyl, and -S-alkylenyl-R_4;
30   R_6 is a radical selected from the group consisting of -CN, -COOH, -C(O)O-alkyl,   -C(O)O-alkylenyl-R_4,   -C(O)-alkyl, -C(O)-alkylenyl-R_4, -C(O)-halogen, -C(O)NH$_2$, -C(O)NH-alkyl, -C(O)NH-alkylenyl-R_4;
35   R_7 is a radical selected from the group consisting of O, NH, and S; and
                    R_8 is N, O or S; and

-27-

R$_2$ and R$_3$ are each independently selected from the group consisting of alkyl and alkylenyl-R$_{10}$, wherein R$_{10}$ is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal, and spiperone-3-yl,

or R$_2$ and R$_3$ together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs, halogen, alkyl-R$_{10}$, carbonyl, spiperone, spiperone ketal and spiperone-3-yl,

and further wherein one or more of the hydrogen, halogen or carbon atoms are optionally replaced with a radiolabel.

22.   A composition comprising a compound of formula (I):

wherein:

R$_1$ is selected from the group consisting of -C(O)-alkyl, -C(O)-alkylenyl-R$_4$, -C(O)O-alkyl, -C(O)O-alkylenyl-R$_4$, -C=C(CN)$_2$-alkyl, -C=C(CN)$_2$-alkylenyl-R$_4$,

 and

wherein

R$_4$ is a radical selected from the group consisting of alkyl, substituted alkyl, aryl and substituted aryl;

R$_5$ is a radical selected from the group consisting of -NH$_2$, -OH, -SH, -NH-alkyl, -NHR$_4$, -NH-alkylenyl-R$_4$, -O-alkyl, -O-alkylenyl-R$_4$, -S-alkyl, and -S-alkylenyl-R$_4$;

R$_6$ is a radical selected from the group consisting of -CN, -COOH, -C(O)O-alkyl,   -C(O)O-alkylenyl-R$_4$,   -C(O)-alkyl, -C(O)-alkylenyl-R$_4$, -C(O)-halogen, -C(O)NH$_2$, -C(O)NH-alkyl, -C(O)NH-alkylenyl-R$_4$;

R$_7$ is a radical selected from the group consisting of O, NH, and S; and

R$_8$ is N, O or S; and

R$_2$ is selected from the group consisting of alkyl and alkylenyl-R$_{10}$ and R$_3$ is alkylenyl-R$_{10}$, wherein R$_{10}$ is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal, and spiperone-3-yl,

1   or R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs, halogen, alkyl-R_{10}, carbonyl, spiperone, spiperone ketal and spiperone-3-yl,

and further wherein one or more of the hydrogen, halogen or carbon atoms are

5   optionally replaced with a radiolabel.

       23.   A composition according to claim 22, wherein the compound of formula (I) is radiolabeled with ^{18}F or ^{123}I.

10   24.   A composition according to claim 22, comprising a compound of formula (II):

(II)
                                                                      wherein

         R_2 is selected from the group consisting of alkyl and alkylenyl-R_{10} and R_{10}

20   is alkylenyl-R_{10}, wherein R_{10} is selected from the group consisting of -OH, -OTs, halogen, spiperone, spiperone ketal and spiperone-3-yl,

         or R_2 and R_3 together form a heterocyclic ring, optionally substituted with at least one radical selected from the group consisting of alkyl, alkoxy, OH, OTs, halogen, alkylenyl-R_{10}, carbonyl, spiperone, spiperone ketal and spiperone-3-yl,

25   and R_9 is an alkyl group;

or a pharmaceutically acceptable salt or solvate thereof;

and further wherein one or more of the hydrogen, halogen or carbon atoms are optionally replaced with a radiolabel.

30   25.   A composition according to claim 24, wherein the compound of formula (II) is radiolabeled with ^{18}F or ^{123}I.

       26.   A composition according to claim 22, wherein the compound of formula (I) is 2-(1,1-dicyanopropen-2-yl)-6-(2-[^{18}F]-fluoroethyl)-methylamino)-naphthalene.
